

KM3NeT science and multi-messenger synergies

D. Dornic (CPPPM/CNRS)

On behalf the KM3NeT Collaboration

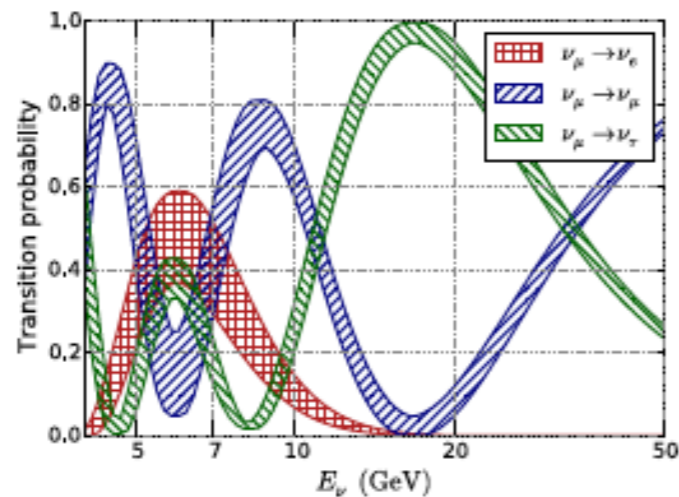

Groningen — 2019/03/27

KM3NeT Science cases

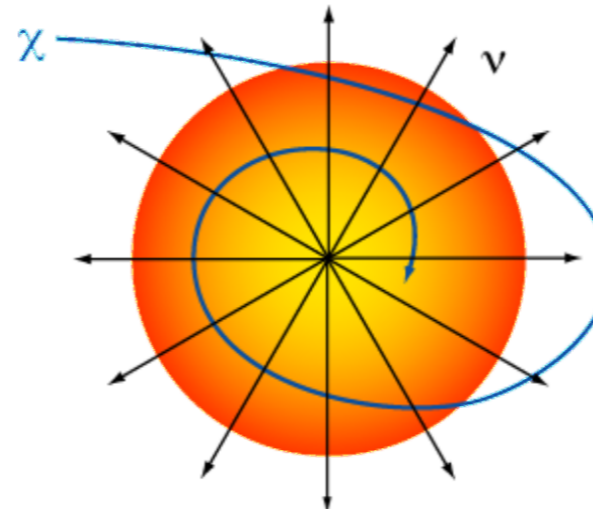

- A vast multi-disciplinary program

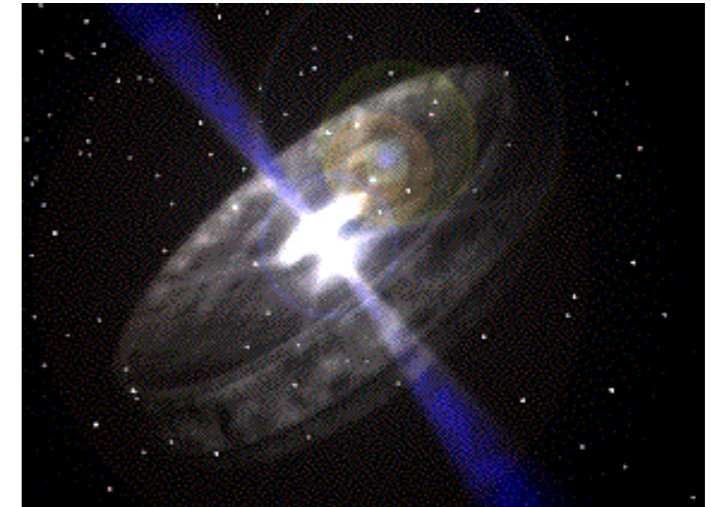

Low Energy
 $\text{MeV} < E_\nu < 20 \text{ GeV}$

Oscillations,
 supernova

Medium Energy
 $20 \text{ GeV} < E_\nu < 10 \text{ TeV}$

Dark matter,
 exotic particles

High Energy
 $E_\nu > 10 \text{ TeV}$

Sources of ν , diffuse
 flux, link to CR

+ Oceanography, marine biology, seismology

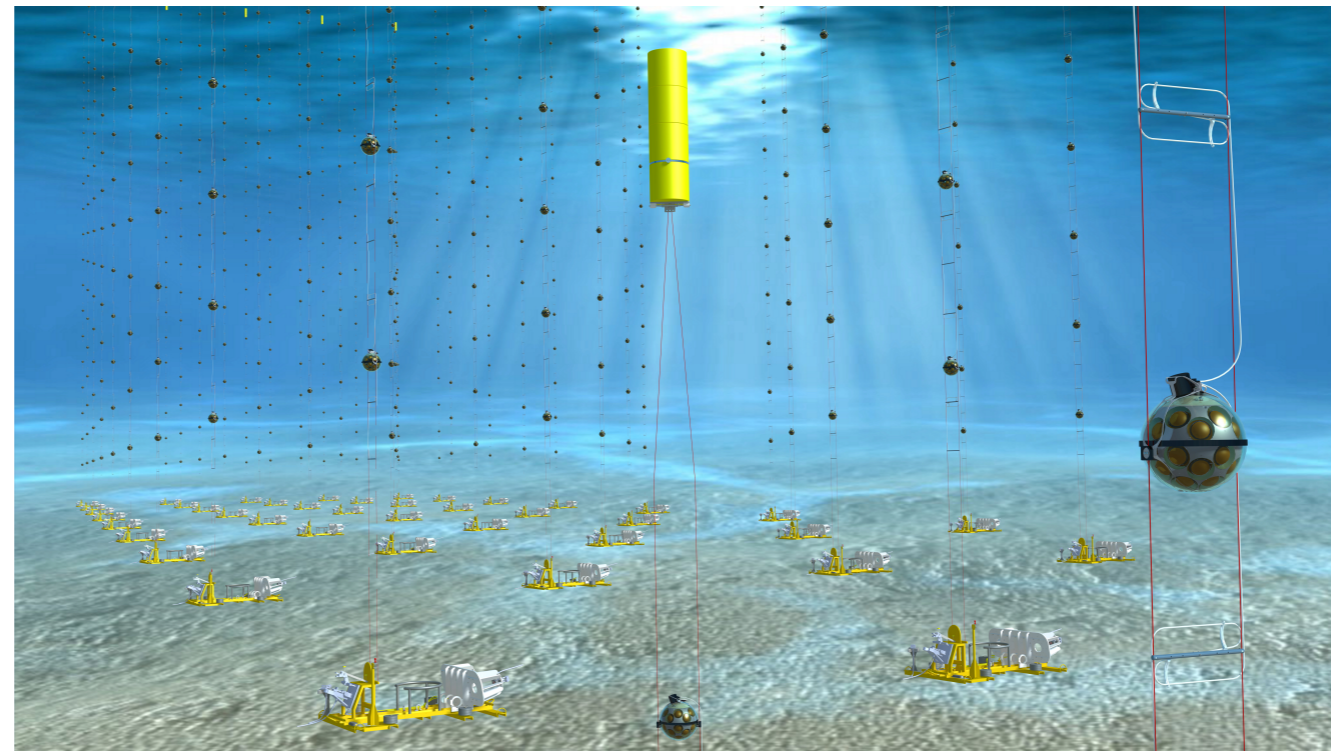

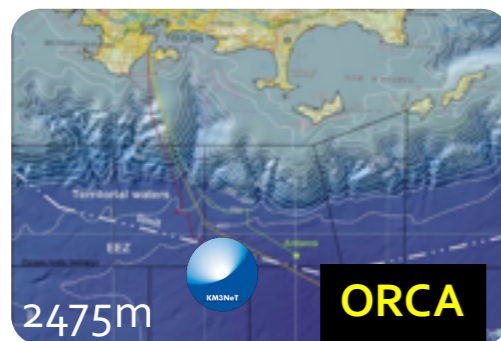

KM3NeT detectors

KM3NeT is the neutrino research infrastructure in the deep Mediterranean Sea

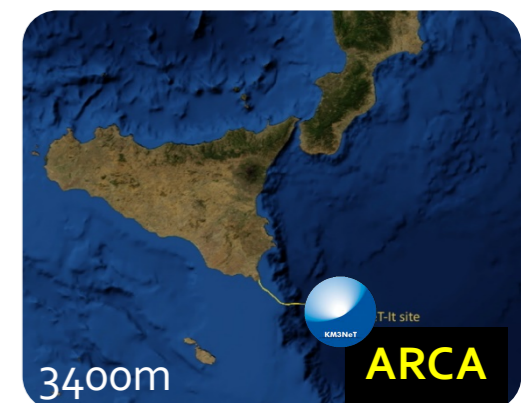

Oscillation
Research
with Cosmics
In the Abyss

ORCA: off shore
Toulon, France

Astroparticle
Research
with Cosmics
In the Abyss

ARCA: off shore
Capo Passero, Italy

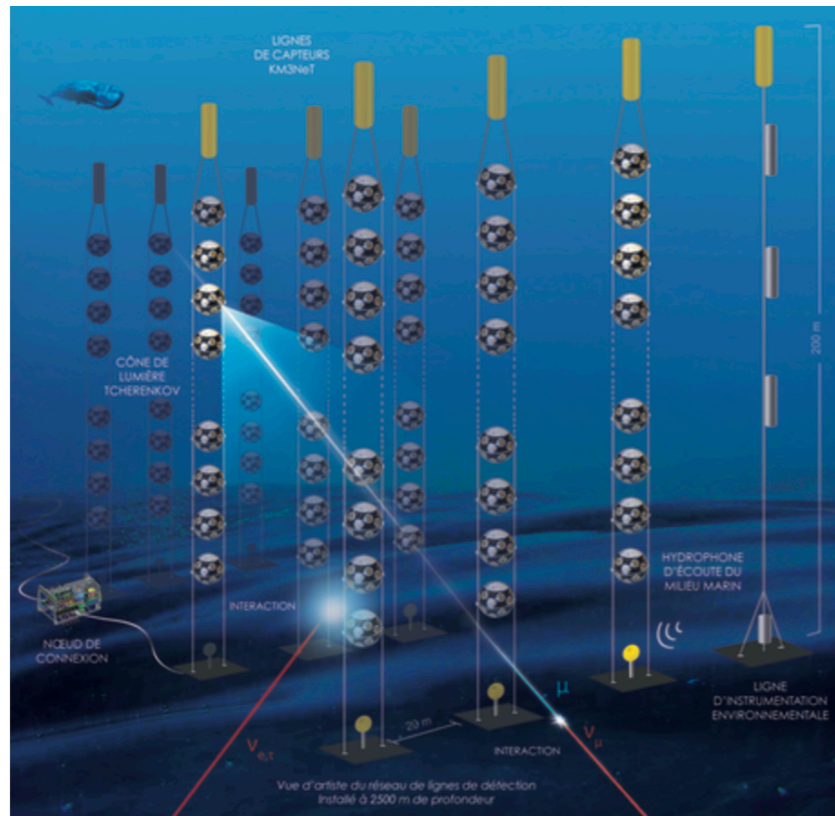

Same collaboration, same technology, two installation sites

- **31** 3-inch PMTs = 1 Digital Optical Module (DOM)
- **18** DOMs = 1 Detection Unit (DU)
- **115** DUs = 1 Building Block (BB)
- **6 DUs ORCA + 24 DUs ARCA = KM3NeT Phase 1**
- **1 BB ORCA + 2 BB ARCA = KM3NeT Phase 2**

	ARCA	ORCA
DU distance	90 m	20 m
DOM spacing	36 m	9 m
Instrumented mass	2*500 Mton	5.7 Mton

KM3NeT in number for astronomy

Main characteristics:

- Extended energy range: $\sim 3 \text{ GeV} \rightarrow > 10 \text{ PeV}$
- Full sky coverage with the best sensitivity for the galactic sources
- High duty cycle ($> 90\text{-}95\%$)
- All flavour neutrino detection
- Good angular resolution

⇒ Construction on-going: at present 1 DU working in ARCA and in ORCA + 5 DUs ready for deployment in ORCA (>300 DOMs buildied)

⇒ Mid 2020, better sensitivities than ANTARES in the whole energy range.

- **ARCA dedicated to neutrino astronomy:**

⇒ Tracks (100 TeV - 10 PeV) with the excellent angular resolution ($<0.2^\circ$)

⇒ Cascades (100 TeV - 10 PeV) thanks to the good angular resolution ($1\text{-}2^\circ$) and taking advantages of the low atmospheric background contribution

- **ORCA can do also astronomy:**

⇒ Tracks & cascades at low energy (few GeV - 10 TeV), looking for time/space clusters

⇒ Example sources: winds of binaries, choked GRBs, hidden jets in core-collapse SN

- **ORCA & ARCA:** detection of MeV neutrinos from ccSN

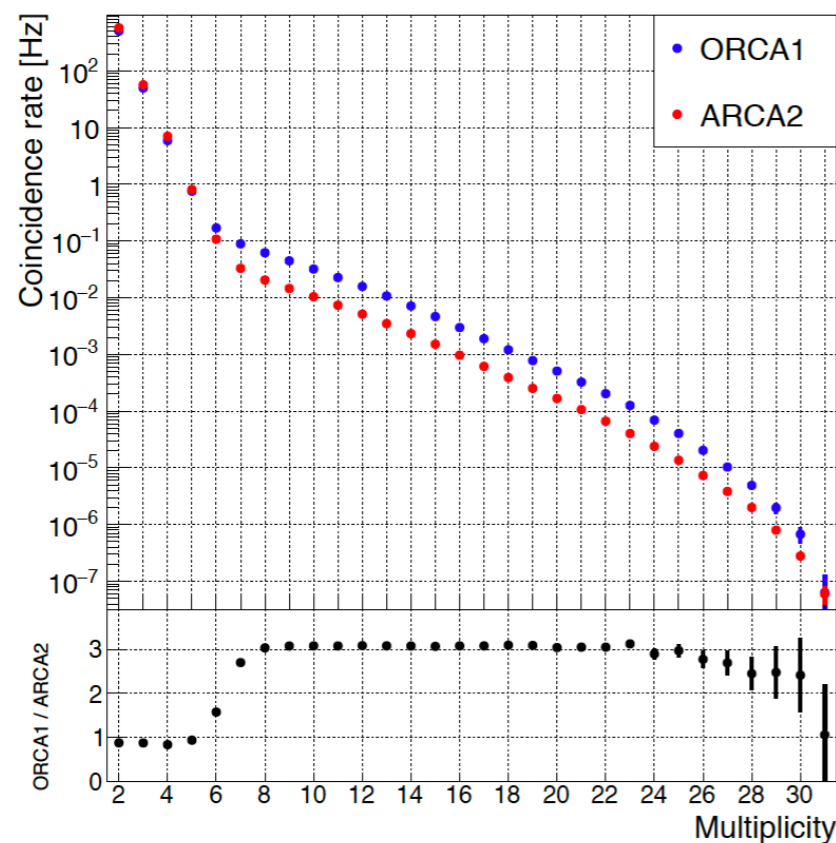

KM3NeT first data

ARCA2 and ORCA1 data analysed to estimate the detector stabilities, the performances of the calibration methods (PMT detection efficiencies, time offsets) with detailed run-by-run simulations: good understanding of the PMTs / DOMs and the environment properties.

⇒ Neutrino events already detected in each site.

Average coincidence rates

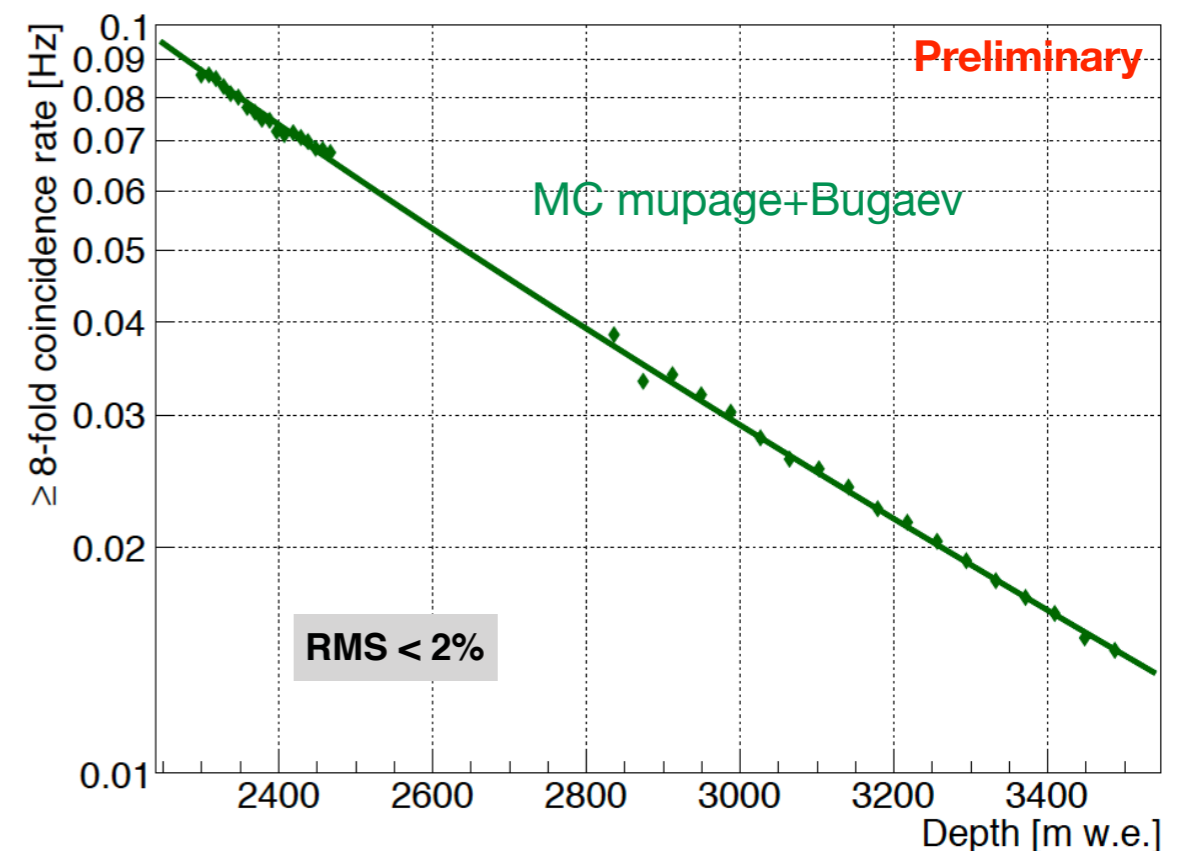

40K

Muons

ccSN

(SN search: M. Lincetto talk tomorrow)

Muon coincidence rates vs depth

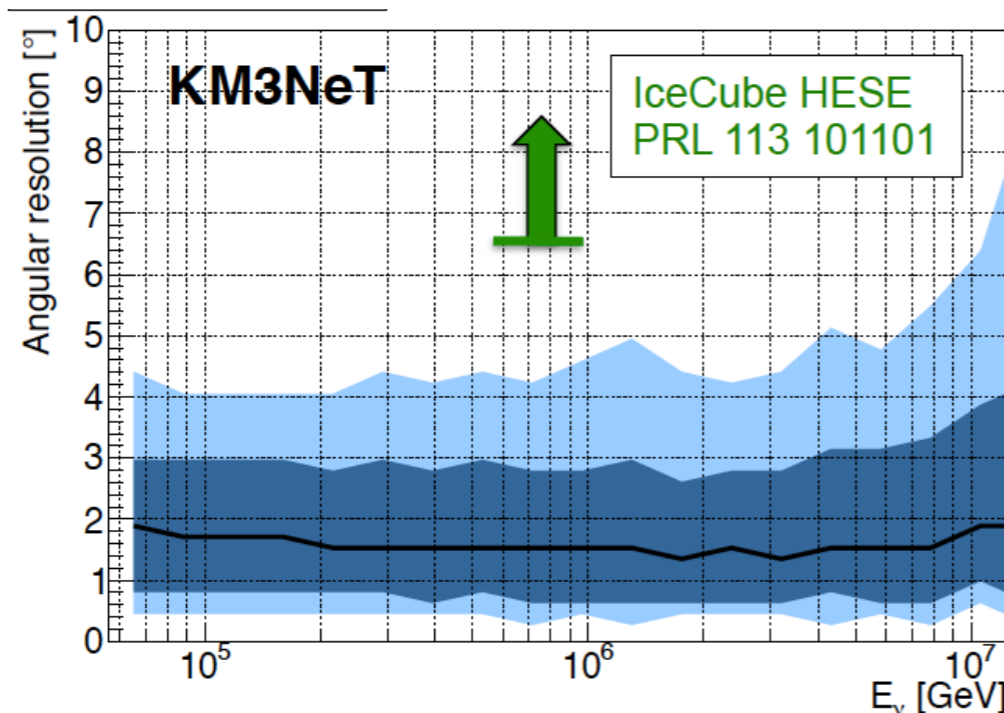

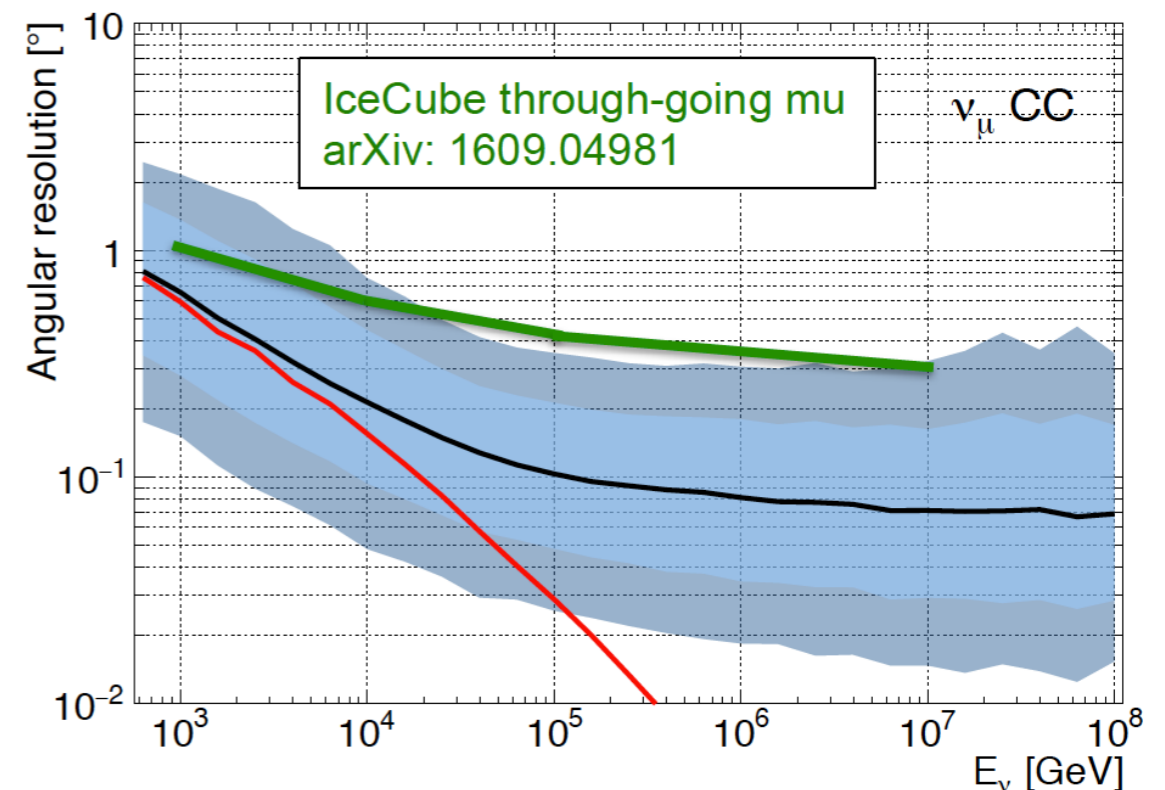

KM3NeT performances

Tracks:

- Direction:
 - ➔ Gal. sources: **0.2° at 10 TeV**
 - ➔ Extra-gal. sources: **0.1° at 100 TeV**
- Energy: **0.27** in Log10(E)

For ORCA, **2° at 100 GeV, 1° at 1 TeV**

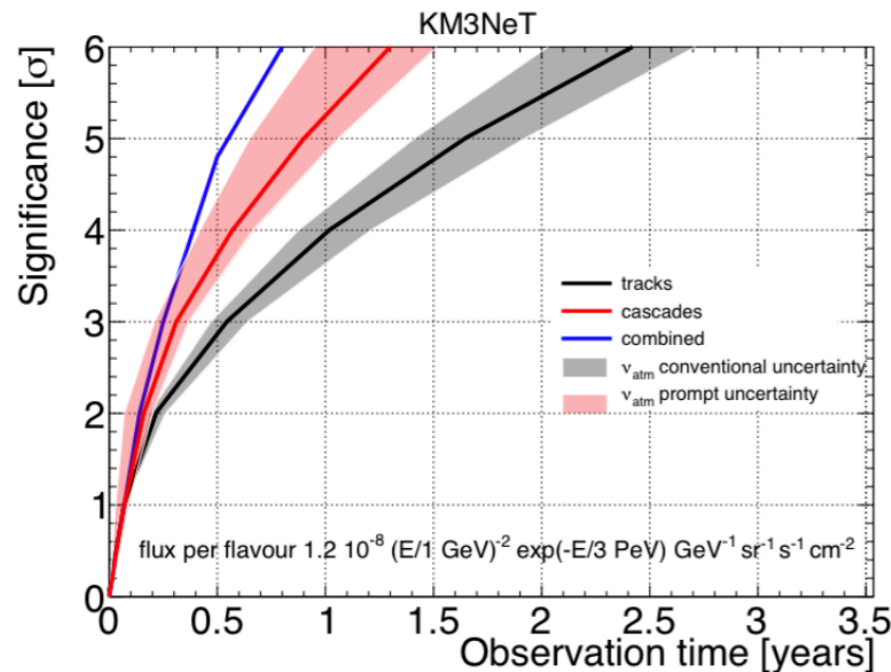

Cascades:

- Vertex: 6-8m (long), 0.5m (perp)
- Direction: **~1.5°**
- Energy: **5%**

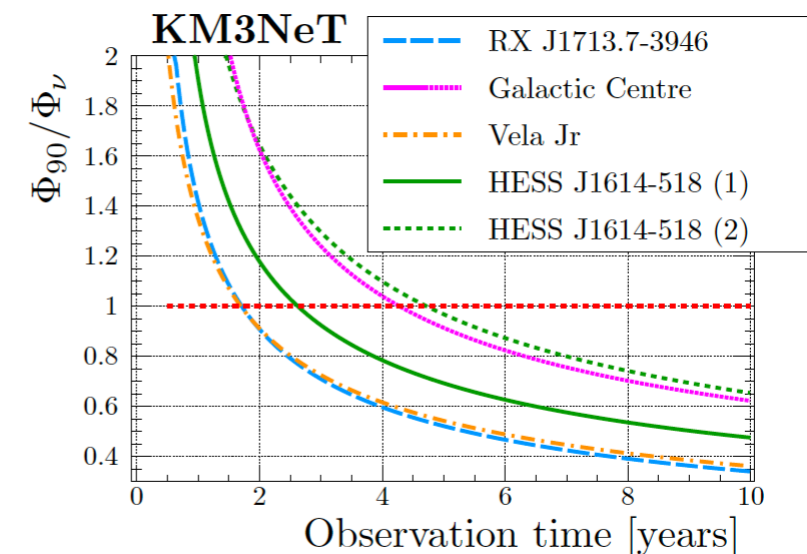

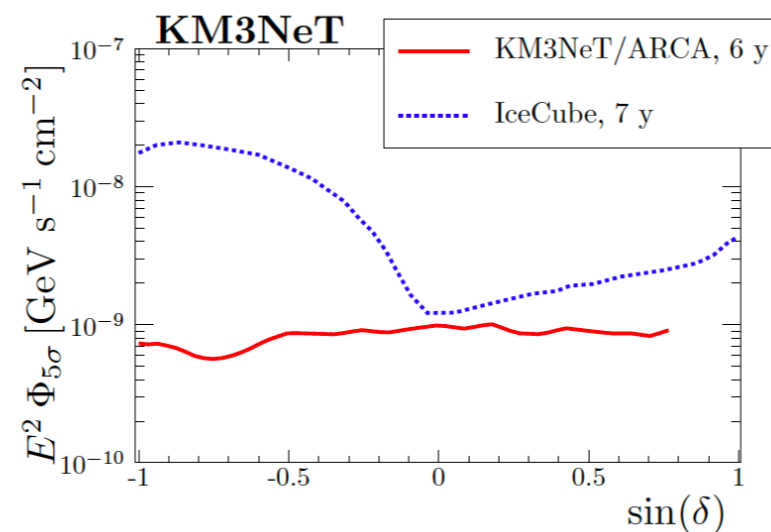

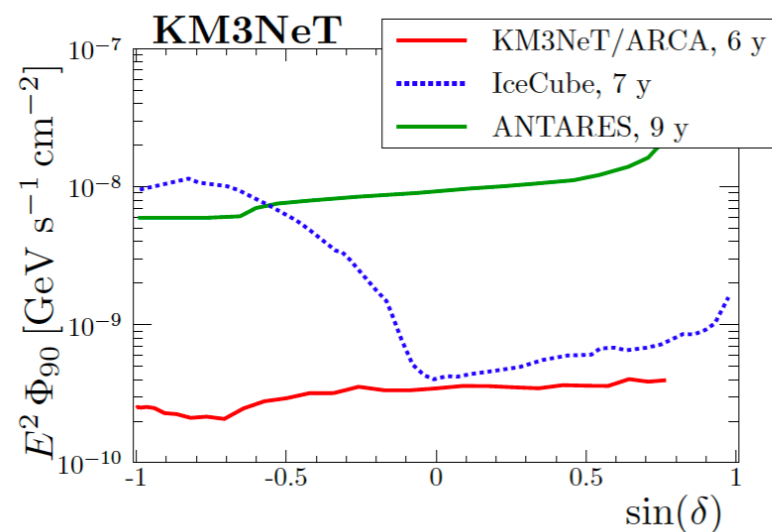

For ORCA, **3-4° at 100 GeV**

KM3NeT expected performances

Full ARCA will be able to detect the IceCube cosmic diffuse flux in less than 1 year.
 \Rightarrow Investigate isotropy, spectral shape, flavor composition.

Point-like steady search sensitivities: 1st targets are the galactic sources (thanks to the detector localisation)

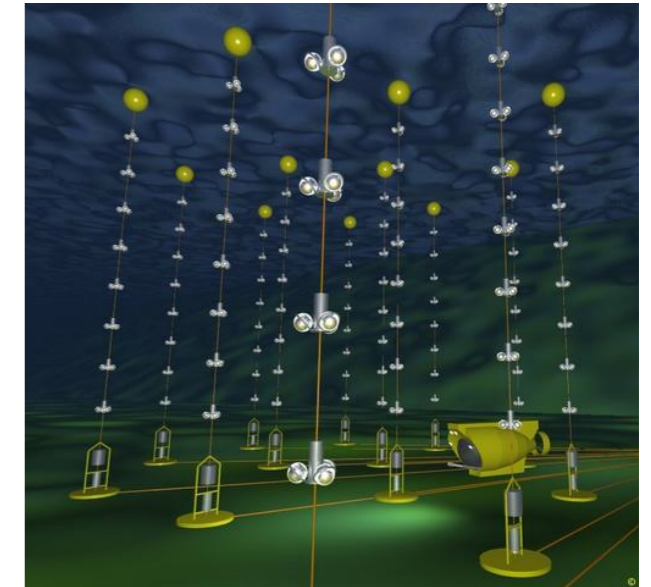

ANTARES multi-messenger program

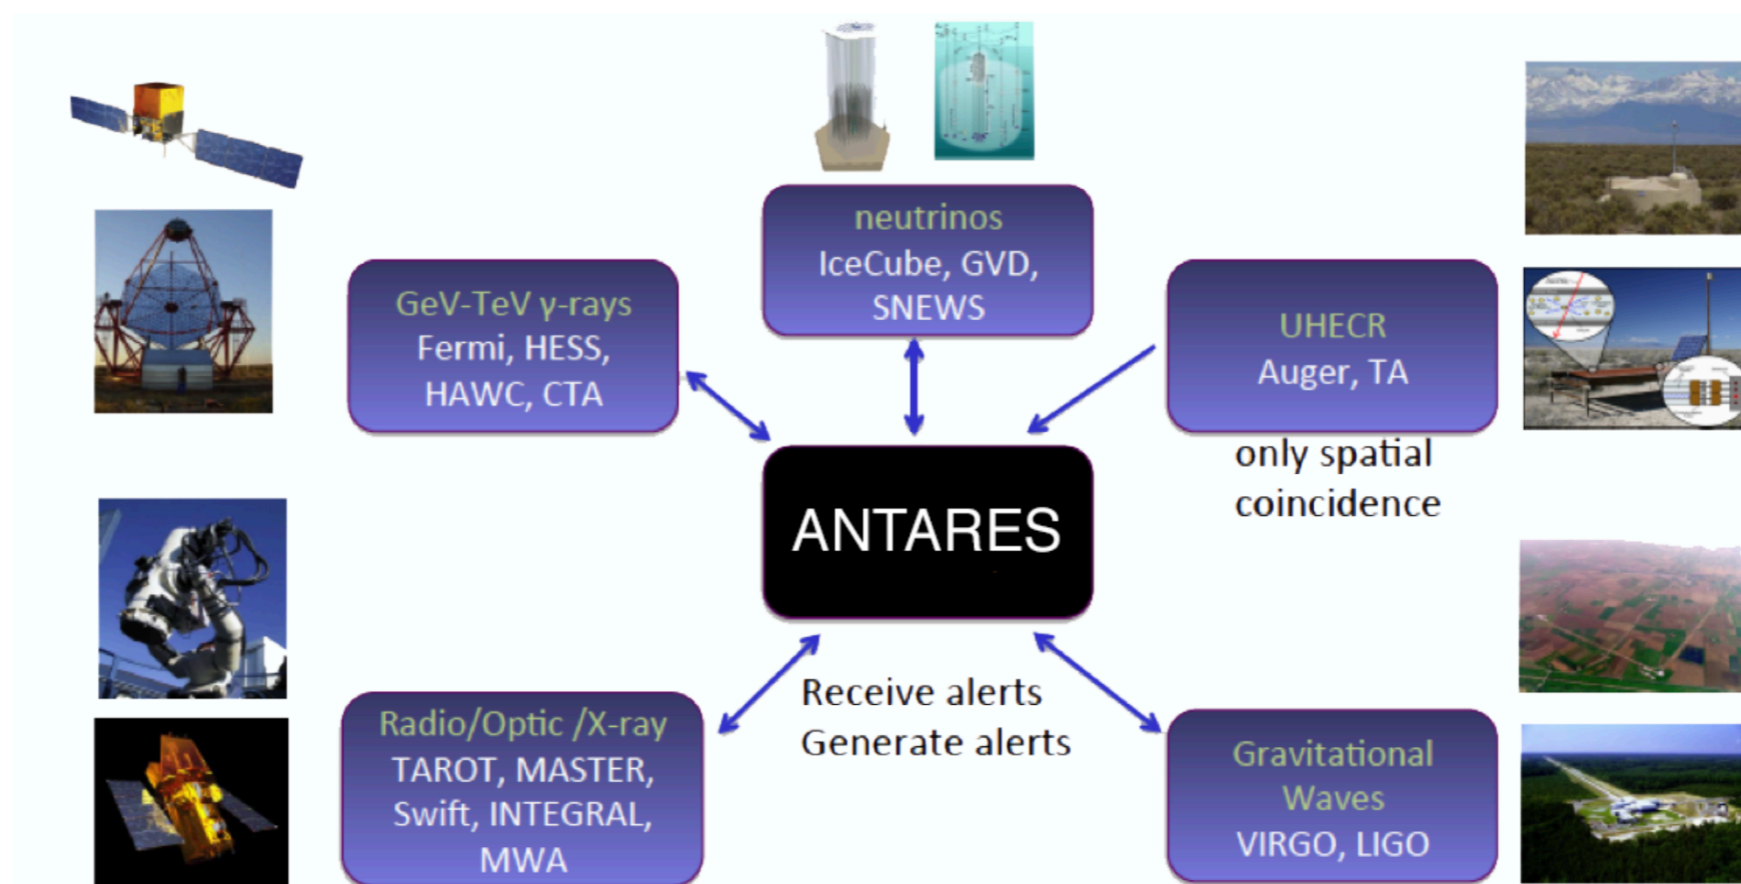

ANTARES in numbers:

- Stable data taking since 2007 with high duty cycle (>95% efficiency)
- Large field of view (2π instantaneously)
- Quite good angular resolution: $0.3-0.4^\circ$ (median)
- But it is also small: $A_{\text{eff}} \approx 1\text{m}^2$ @ 30 TeV (~ 12000 detected neutrinos)
- Real-time data processing

Very large multi-messenger program:

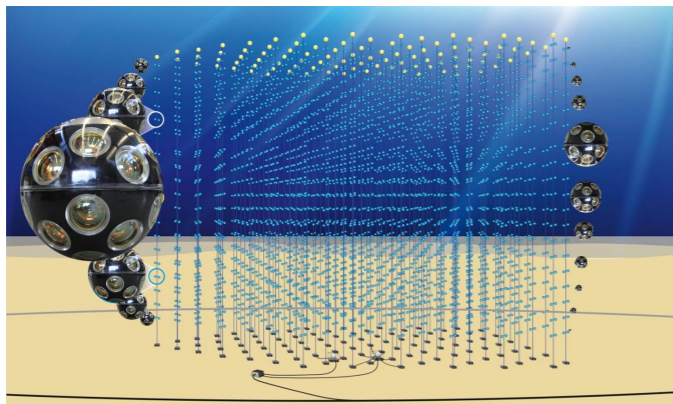

(See M. Colomer's talk)

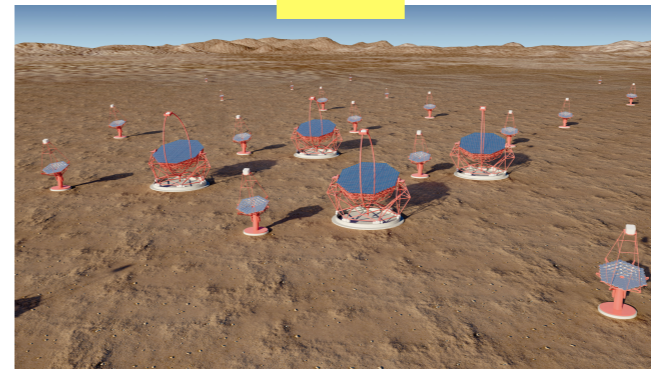

KM3NeT multi-messenger programs

- Follow-up of neutrino alerts
- Joint sub-threshold analysis

KM3NeT

CTA

LSST

HAWC/LHAASO

LIGO/VIRGO

MWA/Parkes/SKA

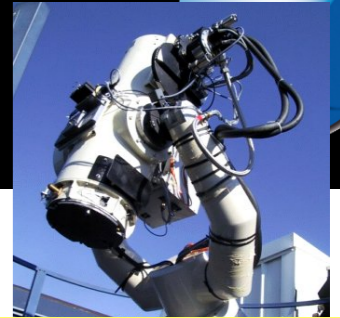

ELT

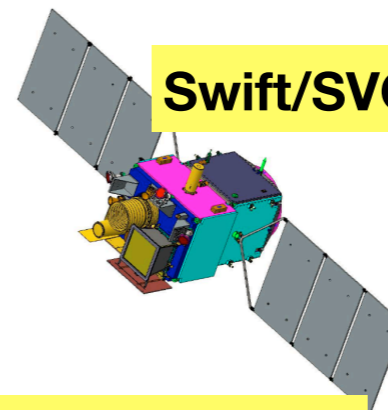

- Follow-up of EM/GW alerts
- Offline time/space correlation search with catalogues (GRB, AGN, XRB, SN, FRB...)

MASTER/TAROT

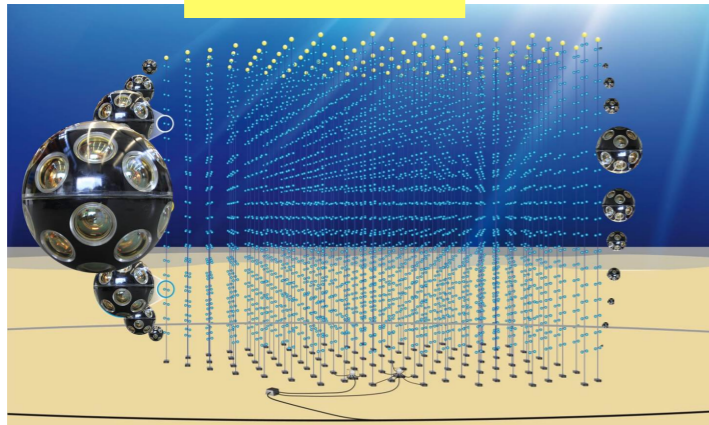

Swift/SVOM

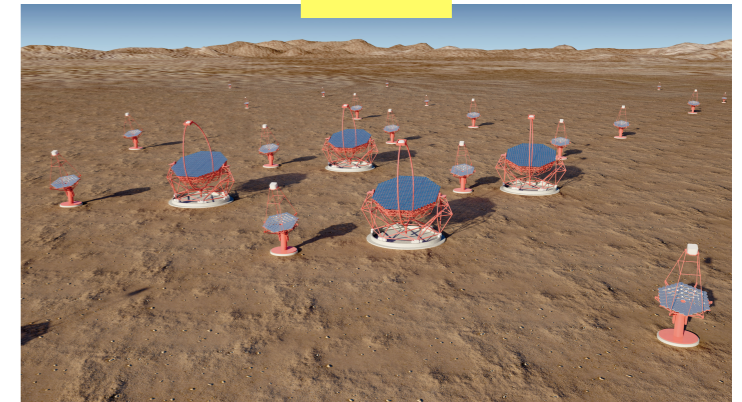

Synergies ESFRI facilities

KM3NeT

CTA

Send HE ν alerts in real-time
Receive HE γ triggers in real-time
Get updated source catalogues (SNR, PeVatrons, AGN...)

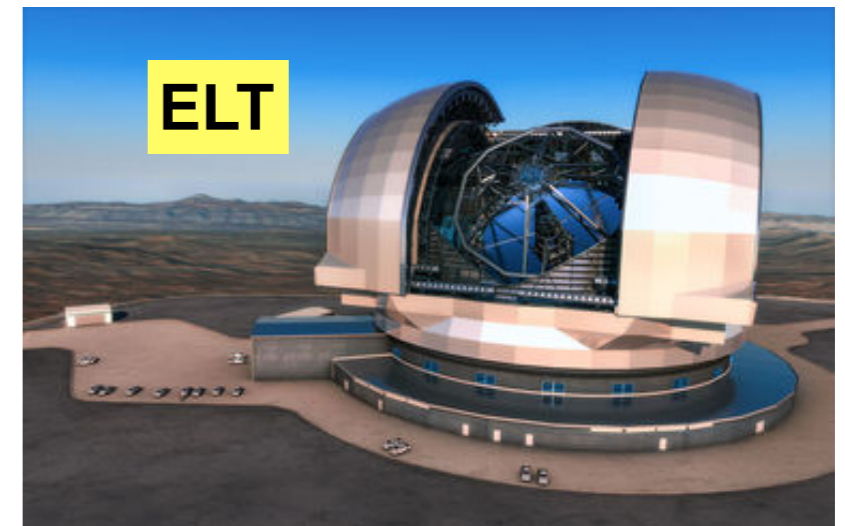

Send HE ν alerts in real-time
Receive radio triggers in real-time (FRB...)
Get updated source catalogues

Send HE ν alerts via ToO for redshift, host galaxy studies

SKA

ELT

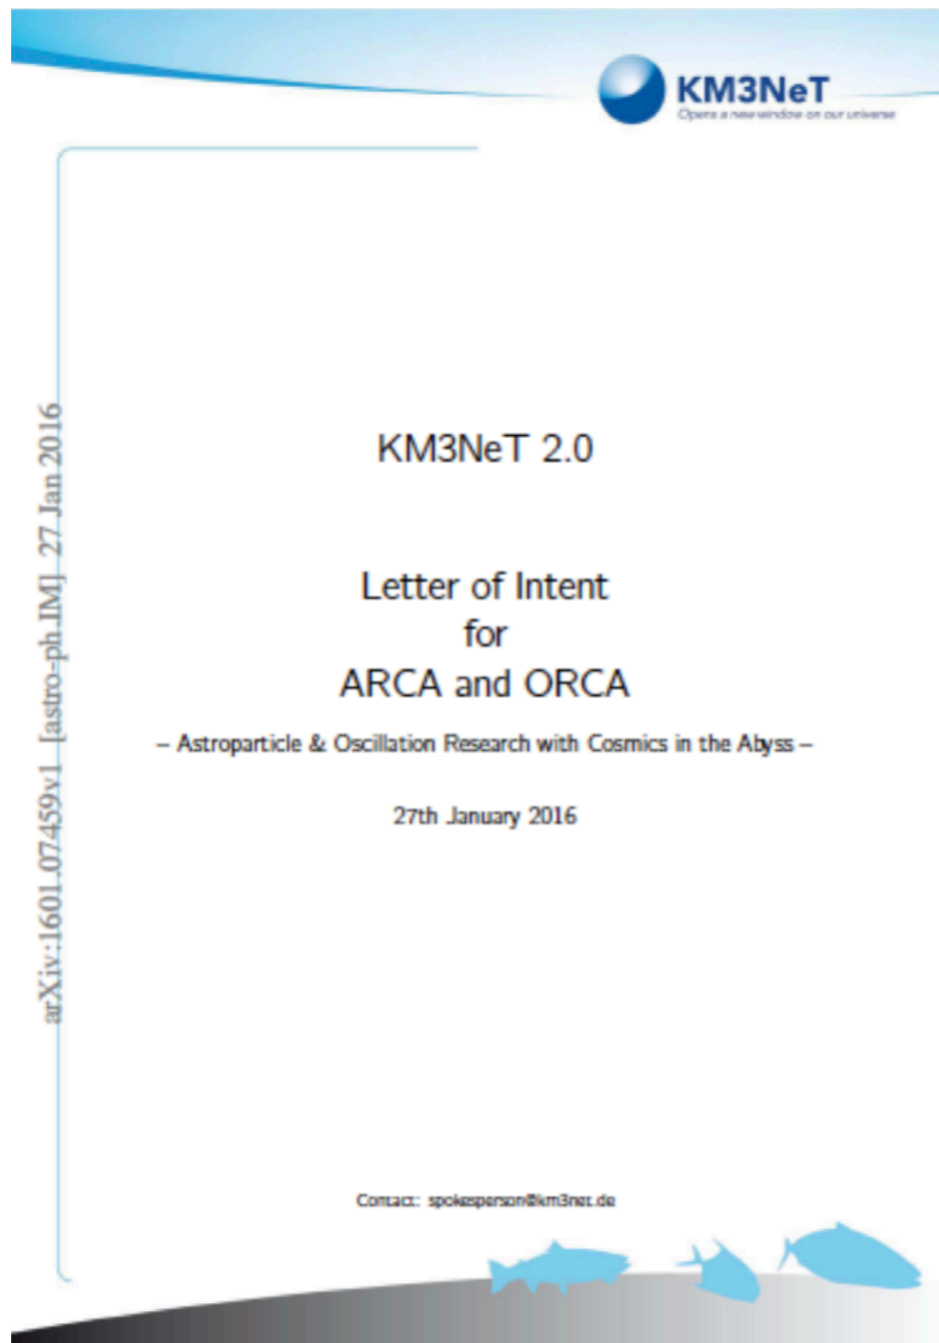

Summary

- Detection of gravitational waves (LIGO/Virgo), cosmic HE neutrinos (IceCube) and the first Galactic PeVatron (H.E.S.S.) \Rightarrow **new era of multi-messenger astronomy.**
- **With ANTARES, we have performed plenty multi-messenger analyses with 12 years of data** (See Talk of M. Colomer tomorrow)
 \Rightarrow ANTARES will be probably decommissioned next year and pass the baton to KM3NeT.
- By observing astrophysical neutrinos with **good angular resolution, an extended energy range and a full sky coverage with a high duty-cycle**, KM3NeT will play a key role.
- **Important synergies with others facilities** such as CTA, SKA, LVC, ELT, SVOM, etc: mutual real-time follow-ups, exchanges of data (flares, spectral/angular shapes...)

KM3NeT 2.0: Letter of Intent

More details on KM3NeT technologies and science cases in the Letter of Intent: [arXiv/1601.07459](https://arxiv.org/abs/1601.07459) J. Phys. G: Nucl. Part. Phys. 43 (2016) 084001

⇒ Since then, large improvement in the event reconstructions and analysis method. + Analysis of 1st ORCA/ARCA data. Updates planned end of this year

KM3NeT data policies

- ➔ KM3NeT neutrino data are proprietary but become public after a latency of 2 years after the data taking.
- ➔ However, **significant events might trigger alerts** that will be distributed **publicly** to the astro community using standard **VO event** format within **~10s** after the neutrino detection
- ➔ **Sub-threshold alerts** and **multiplets** will be distributed through **private channel** to observing teams upon **MoU agreements**.
